Team Name : Nix AI

Team Leader Name : Chunduri Manohar

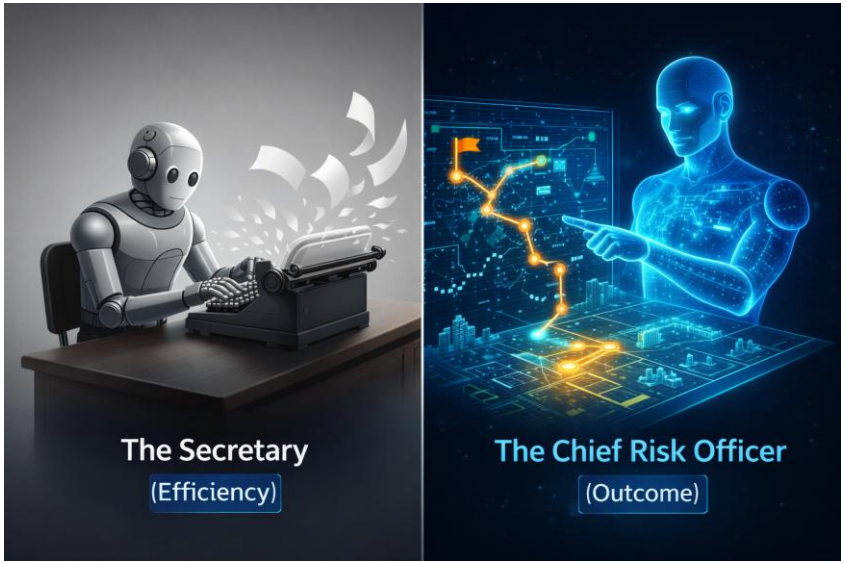
Problem Statement : Mitigating the $2B/year loss in Clinical Trials by predicting Regulatory & Payer Rejection using Adversarial AI

Idea (NIX AI)

- NIX AI don't just check if your drug is safe, it check if it is sellable. By simulating the competing demands of Regulators (Safety) and Insurers (Cost), we uncover critical gaps where a product might be approved but fail to get reimbursed—securing your revenue path early.
- Nix AI validates your strategy from every critical angle simultaneously. It balances the strict safety requirements of the FDA against the cost-saving demands of Insurance Payers, ensuring your clinical design satisfies all decision-makers, not just one.
- Many drugs are approved but never make money because insurers won't pay for them. Nix AI identifies these "Profitability Gaps" before you start your trial, ensuring your clinical strategy aligns with commercial reality.
- Top-tier regulatory consultants charge $500+/hour, making high-quality audit inaccessible for smaller biotech startups. Nix AI democratizes this access, giving every Indian startup a "World-Class Regulatory Team" for the cost of a cloud subscription.

Solution

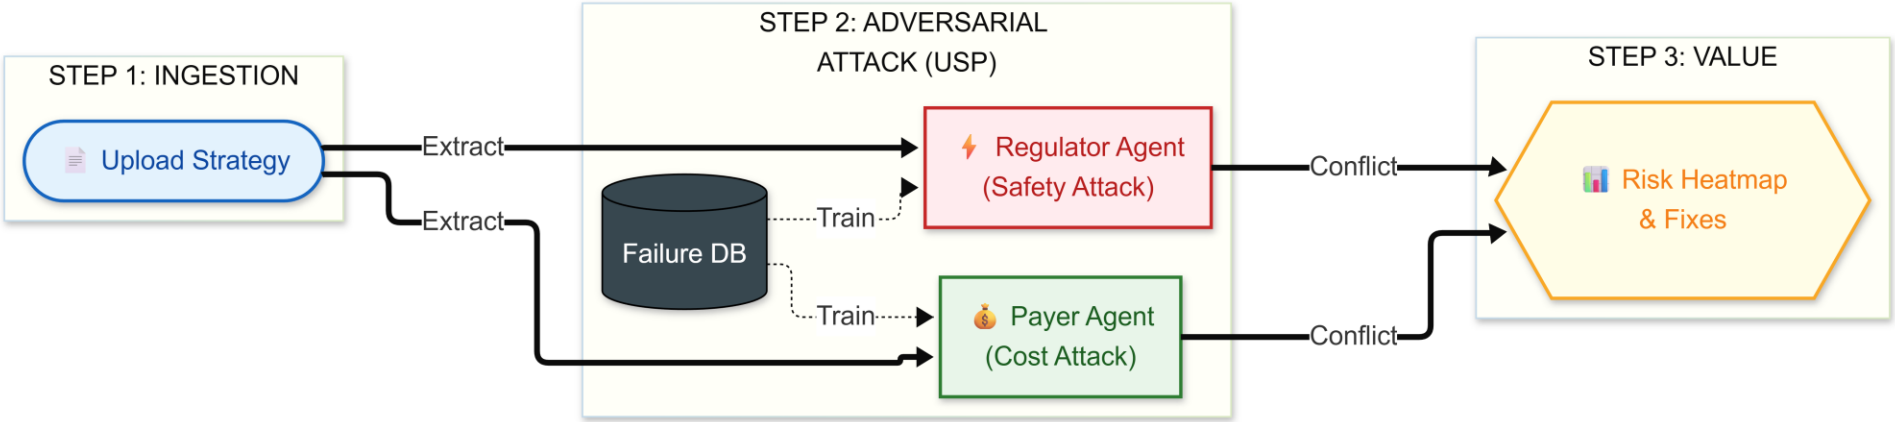
- While many competitors focus on Efficiency, they act like intelligent "Secretaries," helping teams draft and format documents faster. Nix AI: Focuses on Outcome. We act as a "Chief Risk Officer," critiquing the strategy itself. We don't just help you write the application; we tell you if the application will win or lose.
- Nix AI runs your clinical strategy through a "Virtual Stress Test" that mimics the real-world conflicting demands of Safety Regulators and Cost-Conscious Insurers.
- By identifying commercial and regulatory "deal-breakers" months before submission, companies can pivot their strategy early—transforming a potential 14-month delay into a seamless approval.
- While other platforms are trained on Guidelines (Theory), Nix AI is the only platform trained on Historical Rejections (Reality). We leverage the proprietary data of why thousands of previous drugs failed to build a protective shield around yours.



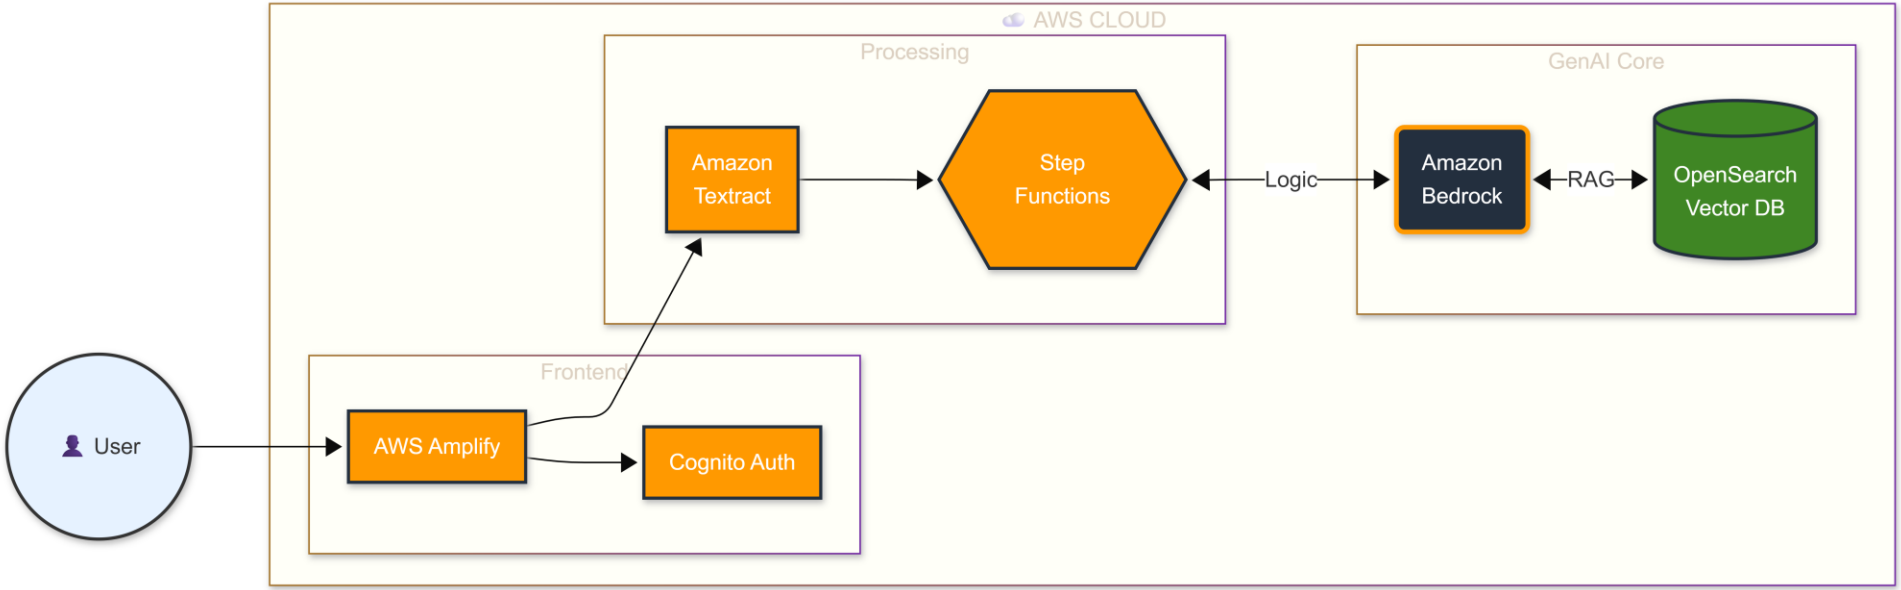
Features

- The "Adversarial Council": Deploys conflicting AI agents—The Regulator (Safety) vs. The Payer (Cost)—to debate and attack your protocol from opposing angles.
- Strategic Friction Heatmap : A visual "X-Ray" of your document that highlights exactly where Regulatory Safety conflicts with Commercial Viability (e.g., "Safe, but too expensive").
- "Smart Pivot" Recommendations: Doesn't just flag errors; generates actionable Business Pivots. (e.g., "Shift trial sites to Region B to lower costs while maintaining FDA compliance").
- Powered by "Failure Intelligence": The only platform trained on thousands of Historical Rejection Letters, utilizing the "negative knowledge" of why past drugs failed to protect yours.
- Real-Time Compliance: Continuously monitors global policy changes. If a new law passes today that invalidates your strategy, you get an alert instantly.

Process flow



Architecture



Technologies to be used in the solution:

- Python, Typescript
- FastApi, ReactJS, LangChain/LangGraph
- Vector DB, PostgreSQL, Redis
- Kubernetes, Git
- AI Services (Text Extract, Voice services)

Estimated implementation cost

- Cost to Build MVP: ~$10,000.
